
Outline Approach

Root issue: *In one sentence, describe the Problem Statement*

A non-training team "Evergreen" needs to create internal training material but the team is not familiar with the best ways to accomplish this.

Approach: *Answer each Question from the Needs Analysis document*

After filling out a Needs Analysis it was determined that Evergreen:

- Needs to understand the various methods of ID at a high-level
- Needs the training by the end of the quarter at request of Evergreen's management
- Will be able to provide effective training if it knows the different types
- Will benefit with an instructor-led classroom course explains ID types
- Will be able to provide improved customer service if it understands the best ways to conduct training
- Will measure effectiveness based on how many trainings it creates compared to number of decreased calls for training by the outlying teams

Deliverables: *Describe the expected output*

1. Instructor Guide
2. Classroom setup manual
3. Instructional PowerPoint deck
4. High-level course brochure that explains four different types of Instructional Design processes.

Course Specification: *Describe the course's learning objectives and skills and knowledge a graduate from that course will possess, and how it is taught and assessed*

The Instructional Design Process Course describes four different types of Instructional Design processes, how each approaches the same user scenario and how to apply each process to a student's own scenario; the course is delivered via classroom facilitation, and its effectiveness is assessed based on how many trainings the Evergreen team creates compared to the number of decreased calls for training by the outlying teams.

Outline

Intro

- Training accomplished many ways, many processes, and we'll describe a few of them in this course
- Scenario to be used throughout course
 - ***Company has just purchased a new Knowledge Base application to improve its customer service and we need to understand how to use it***
- Expected Outcomes
- Agenda

ADDIE

- One of if not most widely used model. If you only learn one ID process, this is it
 - **Analysis:** Why is training needed? Gather info from business to determine content
 - **Design:** Determine strategy; write objectives; chose media & delivery methods
 - **Development:** Build training materials
 - **Implementation:** Rollout the course and monitor impact
 - **Evaluation:** Collaborate with end users to determine effectiveness; use surveys, feedback
- Example how this works with our scenario
 - **Analysis**
 - New tool requires new training
 - Set up meetings with application owner and business to understand what content exists and how it can be leveraged to build training
 - **Design**
 - Strategy: Tool is live already so use Agile method where small bits of training are continuously rolled out and pushed to customers in order of importance (i.e. most widely used portions of application are trained first)
 - Objectives: Customers continuously trained on as-needed basis until all aspects of tool are trained
 - Media/delivery:
 - 80%: Printed/online materials accessible from the Help menu within the tool
 - 20%: Captivate videos for the most visually challenging portions that are otherwise hard to explain in words
 - **Development**
 - Over the course of 6 weeks develop and release training, with weekly touchbases
 - **Evaluation**
 - For each released course is a corresponding survey to be completed within a week of release

Outline

- Surveys reviewed each week and edits to materials are prioritized. Project returns to Analysis phase

Lab 1 (see Labs section at end of document)

Merrill's First Principles of Instruction

- Developed by Professor M. David Merrill, the Principles of Instruction are five interrelated principles used together to increase student learning
- Especially effective ID process for learning tasks or processes that are related to existing tasks or processes
- Broken into five general principles:
 - **Task-centered:** Learning starts with real-world problems. Students should be able to relate to problems and tasks they can handle
 - **Activation:** A course must activate existing knowledge, i.e. connect previous knowledge with new knowledge
 - **Demonstration:** A course must demonstrate the knowledge (both visually and through story telling) so that it leverages different regions of the brain and increases retention
 - **Application:** Allow students to apply new information on their own. Let them practice and learn from their mistakes. Let them see how your new material works in concrete situations
 - **Integration:** Offer possibilities for integrating the knowledge into the learner's world through discussion, reflection, and/or presentation of new knowledge
- Example how this works with our scenario:
 - **Task-centered**
 - Gather actual processes and daily tasks from team and see how these will be accomplished with new tool. Create labs based on these scenarios
 - **Activation**
 - Tie new process with old process by showing the differences between new and old
 - Start with as-was process, then segue into as-will-be process
 - Show results of new process and how it compares to old results
 - **Demonstration**
 - Build mini-scenarios using real-live examples where students have to access the Knowledge Base
 - **Application**
 - Build Labs based on real-live examples, but that purposely access 'new' portions and processes of the tool
 - **Integration**
 - Build quizzes at end of each section
 - Design discussion sessions at the end of each session where moderator asks questions about how the new processes worked for students
 - Ask students to attempt to create scenario(s) where the new processes are more difficult than old processes so that training can focus on solving those difficult areas before go-live

Outline

Lab 2 (see Labs section at end of document)

Outline

Gagne's Nine Steps or Events of Instruction

- Gagne's approach was based on his time as a psychologist in the Army Air Corps, the precursor to the Air Force. His *Nine Events of Instructions* was released in 1965 and is based on the idea that people learn differently so different approaches are required
- The Nine Steps of instruction:
 - **Gain attention of students**
 - **Inform students of objectives**
 - **Stimulate recall of prior learning**
 - **Present the content in easily consumable portions**
 - **Provide guidance**
 - **Elicit performance**
 - **Provide feedback**
 - **Assess performance**
 - **Enhance retention and application to job**
- Example how this works with our scenario:
 - **Gain attention of students:** Discuss how new tool improves performance and therefore an increase in bonuses. Give examples of horror stories with old tool (e.g. difficulty finding information)
 - **Inform students of objectives:** Provide list of how training will be provided (incrementally) and outline every step of the process so there is no doubt as to how training will be accomplished
 - **Stimulate recall of prior learning:** Examples of old processes vs. new processes and how overall they are not that different
 - **Present the content:** As-needed, to-the-point training, delivered weekly instead of all at once
 - **Provide guidance:** Using real-life examples, walk through the steps in the new tool and how it compares to old tool processes
 - **Elicit performance:** Use real-life examples whose processes in the new tool differ from old tool, and have students work through labs without explicit guidance
 - **Provide feedback:** Provide immediate feedback to students on how they handled new processes
 - **Assess performance:** Using quizzes, determine how well knowledge is retained on use of new tool processes
 - **Enhance retention and application to job:** Create Job Aids, Help files, concept maps, and other support tools

Lab 3 (see Labs section at end of document)

Outline

ARCS Model

- Unlike the previous three ID processes previously described, the ARCS Model is called "Motivational Design." This method is focused on why and how humans are motivated to perform tasks and learn processes
- Divided into two realms:
 - Intrinsic (doing an activity for the fun of it, not for any tangible reward)
 - Extrinsic (doing an activity for the reward, not necessarily for any enjoyment)
- The four components are:
 - **Attention:** Initiates motivation for learners
 - **Relevance:** Use language and examples familiar to students
 - **Confidence:** Link learning success to students' personal effort and ability. Use testing and grading. A syllabus is important to give student point of reference to know how he/she will be successful
 - **Satisfaction:** Must use new skills as soon as possible, immediately after learning them
- Example how this works with our scenario:
 - **Attention:** Challenge the students with scenarios that will be easier in the new tool. Offer statistics showing how new tool will improve performance. Surprise them with facts that show why the new tool is such an improvement (or conversely why the old tool needs replacement)
 - **Relevance:** Tie any new processes and terminology to day-to-day scenarios, so learners understand how the new tool is important. Ensure that old vs new terminology is tied together
 - **Confidence:** Provide a detailed syllabus/agenda of the training objectives, learning objectives, and what is expected of the students in the use of this new tool. Provide immediate feedback for labs, but ensure that all testing is prompt (i.e. tests not too spread so that knowledge is lost prior to testing)
 - **Satisfaction:** Build labs that use real-life scenarios to test newly-learned information. If possible, use the production tool as soon as possible in a lab environment so that their 'regular' work is being performed while training, and not something that needs to be made up after class

Conclusion

- Summary of each of the ID processes
- Explain that none are perfect, and can be used together or parts of each in a project

Lab 4 (see Labs section at end of document)

Outline

Labs

Lab 1

Using Post-it notes, have each member of class write down 1-2 real-life scenarios then stick them to the wall in front of the class. Instructor divides class into three groups, then randomly assigns one scenario to each group. Each group collaborates on a training analysis of that scenario, writing brief bullets for each phase of **ADDIE** on the whiteboard. Once completed, Instructor reviews each group's analysis for the entire class.

Lab 2

Instructor assigns each scenario from Lab 1 to a different group. Each group collaborates on a training analysis of that scenario, writing brief bullets for each phase of **Merrill's Principles of Instruction** on the whiteboard. Once completed, Instructor reviews each group's analysis for the entire class, and solicits open feedback on how the steps and results compared to ADDIE. Were the results better? Worse? Which method do you think is more appropriate?

Lab 3

Reorder the three groups so that the same people are not together. Have each group select one of the remaining, unused Post-its off the wall, then perform an analysis using **Gagne's Nine Steps or Events of Instruction**, writing brief bullets for each phase on the whiteboard. Once completed, each group reviews the analysis of the other two teams' analyses (i.e. Instructor is a bystander) and notes its differences with ADDIE and Merrill.

Lab 4

Instructor reviews the remaining unused Post-its and takes a vote of the class to determine which single one should be analyzed by all three teams, still in same groups as Lab 3. Each of the three groups collaborates together and determines which of the four methods is best suited for the scenario. Encourage class to experiment and even mix steps of one process with another, because the aim isn't to only use one process from end-to-end, but determine how to best create a training program for that scenario. Explain why their chosen method is best.
